

Suggested plan for water quality sample data exchange

Phase 1

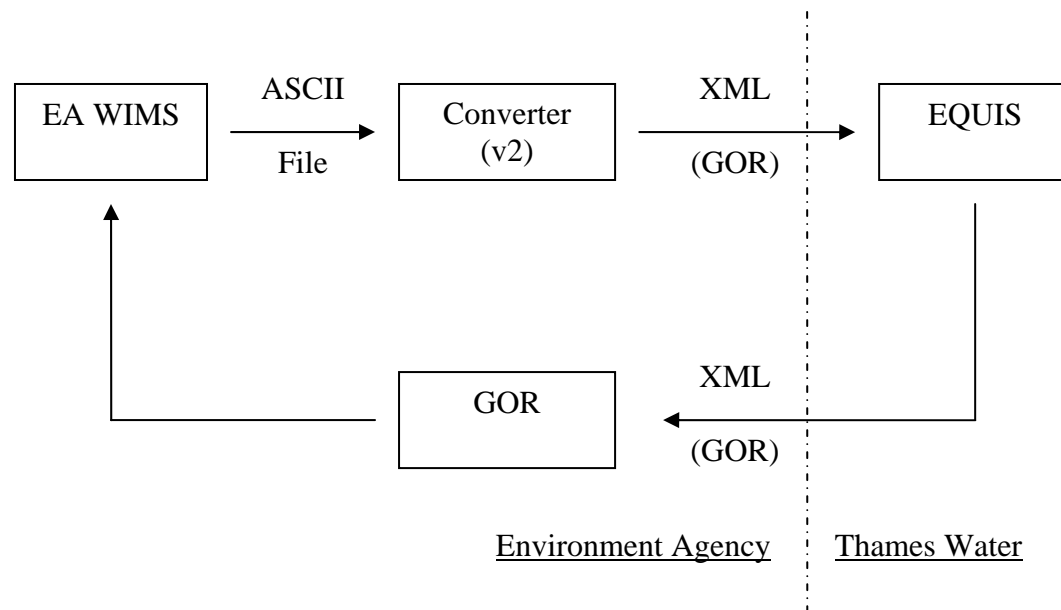

Phase 2

When the Environment Agency define a new XML data standard, for input into the GOR system, Thames Water simply switch to using “Stylesheet #2”. Notice that this step might not even need to exist if the SampleDataExchange data standard is good enough to become the new standard for GOR.

Phase 3

Assuming the XML standard for GOR is different, Thames might eventually want/need to adjust the EQUIS export interface to produce the XML_(GOR) files directly.
